1.1 Overview

TidyPy is a tool that encapsulates a number of other static analysis tools and makes it easy to configure, execute, and review their results.

1.2 Features

- It's a consolidated tool for performing static analysis on an entire Python project – not just your `*.py` source files. In addition to executing a number of different *tools* on your code, it can also check your YAML, JSON, PO, POT, and RST files.
- Rather than putting yet another specialized configuration file in your project, TidyPy uses the `pyproject.toml` file defined by [PEP 518](#). All options for all the tools TidyPy uses are declared in one place, rather than requiring that you configure each tool in a different way.
- Honors the pseudo-standard `# noqa` comment in your Python source to easily ignore issues reported by any tool.
- Includes a number of *integrations* so you can use it with your favorite toolchain.
- Includes a variety of *reporters* that allow you to view or use the results of TidyPy's analysis in whatever way works best for you.
- Provides a simple API for you to implement your own tool or reporter and include it in the analysis of your project.
- Supports both Python 2 and 3, as well as PyPy. Even runs on Windows.

1.3 Usage

When TidyPy is installed (`pip install tidypy`), the `tidypy` command should become available in your environment:

```
$ tidypy --help
Usage: tidypy [OPTIONS] COMMAND [ARGS]...

A tool that executes several static analysis tools upon a Python project
and aggregates the results.

Options:
  --version  Show the version and exit.
  --help     Show this message and exit.

Commands:
  check              Executes the tools upon the project files.
  default-config     Outputs a default configuration that can be used to
                    bootstrap your own configuration file.
  extensions         Outputs a listing of all available TidyPy extensions.
  install-vcs        Installs TidyPy as a pre-commit hook into the specified
                    VCS.
  list-codes         Outputs a listing of all known issue codes that tools
                    may report.
  purge-config-cache Deletes the cache of configurations retrieved from
                    outside the primary configuration.
```

(continues on next page)

(continued from previous page)

remove-vcs	Removes the TidyPy pre-commit hook from the specified VCS.
------------	--

To have TidyPy analyze your project, use the check subcommand:

```
$ tidyipy check --help
Usage: tidyipy check [OPTIONS] [PATH]

Executes the tools upon the project files.

Accepts one argument, which is the path to the base of the Python project.
If not specified, defaults to the current working directory.

Options:
  -x, --exclude REGEX          Specifies a regular expression matched
                                against paths that you want to exclude from
                                the examination. Can be specified multiple
                                times. Overrides the expressions specified
                                in the configuration file.
  -t, --tool_                  Specifies the name of a tool to use during
                                the examination. Can be specified multiple
                                times. Overrides the configuration file.
                                ↳ [bandit|dlint|eradicate|jsonlint|manifest|mccabe|polint|pycodestyle|pydiatra|pydocstyle|pyflakes|py
  -r, --report [console, csv, custom, json, null, pycodestyle, pylint, pylint-parseable, toml,
                                ↳ yaml][:filename]
                                Specifies the name of a report to execute
                                after the examination. Can specify an
                                optional output file name using the form -r
                                report:filename. If filename is unset, the
                                report will be written on stdout. Can be
                                specified multiple times. Overrides the
                                configuration file.
  -c, --config FILENAME        Specifies the path to the TidyPy
                                configuration file to use instead of the
                                configuration found in the project's
                                pyproject.toml.
  --workers NUM_WORKERS        The number of workers to use to concurrently
                                execute the tools. Overrides the
                                configuration file.
  --disable-merge              Disable the merging of issues from various
                                tools when TidyPy considers them equivalent.
                                Overrides the configuration file.
  --disable-progress           Disable the display of the progress bar.
  --disable-noqa               Disable the ability to ignore issues using
                                the "# noqa" comment in Python files.
  --disable-config-cache       Disable the use of the cache when retrieving
                                configurations referenced by the "extends"
                                option.
  --help                       Show this message and exit.
```

If you need to generate a skeleton configuration file with the default options, use the default-config subcommand:

```
$ tidyipy default-config --help
Usage: tidyipy default-config [OPTIONS]
```

(continues on next page)

(continued from previous page)

Outputs a default configuration that can be used to bootstrap your own configuration file.

Options:

`--pyproject` Output the config so that it can be used in a `pyproject.toml` file.
`--help` Show this message and exit.

If you'd like to see a list of the possible issue codes that could be returned, use the `list-codes` subcommand:

```
$ tidyipy list-codes --help
```

```
Usage: tidyipy list-codes [OPTIONS]
```

Outputs a listing of all known issue codes that tools may report.

Options:

`-t, --tool_`
→ `[bandit|dlint|eradicate|jsonlint|manifest|mccabe|polint|pycodestyle|pydiatra|pydocstyle|pyflakes|py`
Specifies the name of a tool whose codes should be output. If not specified, defaults to all tools.

`-f, --format [toml|json|yaml|csv]`
Specifies the format in which the tools should be output. If not specified, defaults to TOML.

`--help` Show this message and exit.

If you want to install or remove TidyPy as a pre-commit hook in your project's VCS, use the `install-vcs/remove-vcs` subcommands:

```
$ tidyipy install-vcs --help
```

```
Usage: tidyipy install-vcs [OPTIONS] VCS [PATH]
```

Installs TidyPy as a pre-commit hook into the specified VCS.

Accepts two arguments:

VCS: The version control system to install the hook into. Choose from:
`git`, `hg`

PATH: The path to the base of the repository to install the hook into.
If not specified, defaults to the current working directory.

Options:

`--strict` Whether or not the hook should prevent the commit if TidyPy finds issues.
`--help` Show this message and exit.

```
$ tidyipy remove-vcs --help
```

```
Usage: tidyipy remove-vcs [OPTIONS] VCS [PATH]
```

Removes the TidyPy pre-commit hook from the specified VCS.

Accepts two arguments:

(continues on next page)

(continued from previous page)

```
VCS: The version control system to remove the hook from. Choose from:
git, hg

PATH: The path to the base of the repository to remove the hook from. If
not specified, defaults to the current working directory.

Options:
--help Show this message and exit.
```

If you'd like to enable bash completion for TidyPy, run the following in your shell (or put it in your bash startup scripts):

```
$ eval "$(_TIDYPY_COMPLETE=source tidypy) "
```

1.4 Docker

If you don't want to install TidyPy locally on your system or in your virtualenv, you can use the [published Docker image](#):

```
$ docker run --rm --tty --volume=`pwd`::/project tidypy/tidypy
```

The command above will run `tidypy check` on the contents of the current directory. If you want to run it on a different directory, then change the ``pwd`` to whatever path you need (the goal being to mount your project directory to the container's `/project` volume).

Running TidyPy in this manner has a few limitations, mostly around the fact that since TidyPy is running in its own, isolated Python environment, tools like `pylint` won't be able to introspect the packages your project installed locally, so it may report false positives around "import-error", "no-name-in-module", "no-member", etc.

If you want to run a command other than `check`, just pass that along when you invoke docker:

```
$ docker run --rm --tty --volume=`pwd`::/project tidypy/tidypy tidypy list-codes
```

1.5 Configuration

TODO

1.6 Ignoring Issues

In addition to ignoring entire files, tools, or specific issue types from tools via your configuration file, you can also use comments in your Python source files to ignore issues on specific lines. Some tools have their own built-in support and notation for doing this:

- `pylint` will respect comments that look like: `# pylint`
- `bandit` will respect comments that look like: `# nosec`
- `pycodestyle` will respect comments that look like: `# noqa`
- `pydocstyle` will also respect comments that look like: `# noqa`
- `detect-secrets` will respect comments that look like: `# pragma: whitelist secret`

TidyPy goes beyond these tool-specific flags to implement `# noqa` on a global scale for Python source files. It will ignore issues for lines that have the `# noqa` comment, regardless of what tools raise the issues. If you only want to ignore a particular type of issue on a line, you can use syntax like the following:

```
# noqa: CODE1, CODE2
```

Or, if a particular code is used in multiple tools, you can specify the exact tool in the comment:

```
# noqa: pycodestyle:CODE1, pylint:CODE2
```

Or, if you want to ignore any issue a specific tool raises on a line, you can specify the tool:

```
# noqa: @pycodestyle, @pylint
```

You can, of course, mix and match all three notations in a single comment if you need to:

```
# noqa: CODE1, pylint:CODE2, @pycodestyle
```

You can disable TidyPy's NOQA behavior by specifying the `--disable-noqa` option on the command line, or by setting the `noqa` option to `false` in your configuration file. A caveat, though: currently `pycodestyle` and `pydocstyle` do not respect this option and will always honor any `# noqa` comments they find.

1.7 Included Tools

Out of the box, TidyPy includes support for a number of tools:

pylint `Pylint` is a Python source code analyzer which looks for programming errors, helps enforcing a coding standard and sniffs for some code smells.

pycodestyle `pycodestyle` is a tool to check your Python code against some of the style conventions in [PEP 8](#).

pydocstyle `pydocstyle` is a static analysis tool for checking compliance with Python docstring conventions (e.g., [PEP 257](#)).

pyroma `Pyroma` tests your project's packaging friendliness.

vulture `Vulture` finds unused code in Python programs.

bandit `Bandit` is a security linter for Python source code.

eradicate `Eradicate` finds commented-out code in Python files.

pyflakes `Pyflakes` is a simple program which checks Python source files for errors.

mccabe Ned Batchelder's script to check the [McCabe](#) cyclomatic complexity of Python code.

jsonlint A part of the [demjson](#) package, this tool validates your JSON documents for strict conformance to the JSON specification, and to detect potential data portability issues.

yamllint The `yamllint` tool, as its name implies, is a linter for YAML files.

rstlint The `restructuredtext-lint` tool, as its name implies, is a linter for reStructuredText files.

polint A part of the [dennis](#) package, this tool lints PO and POT files for problems.

manifest Uses the `check-manifest` script to detect discrepancies or problems with your project's MANIFEST.in file.

pydiatra `pydiatra` is yet another static checker for Python code.

secrets The `detect-secrets` tool attempts to find secrets (keys, passwords, etc) within a code base.

dlint `Dlint` is a tool for encouraging best coding practices and helping ensure we're writing secure Python code.

1.8 Included Reporters

TidyPy includes a number of different methods to present and/or export the results of the analysis of a project. Out of the box, it provides the following:

console The default reporter. Prints a colored report to the console that groups issues by the file they were found in.

pylint Prints a report to the console that is in the same format as [Pylint](#)’s default output.

pylint-parseable Prints a report to the console that is in roughly the same format as [Pylint](#)’s “parseable” output.

pycodestyle Prints a report to the console that is in the same format as [pycodestyle](#)’s default output.

json Generates a JSON-serialized object that contains the results of the analysis.

yaml Generates a YAML-serialized object that contains the results of the analysis.

toml Generates a TOML-serialized object that contains the results of the analysis.

csv Generates a set of CSV records that contains the results of the analysis.

custom Prints output to the console that is in the format defined by a template string specified in the project configuration. The template string is expected to be one allowed by the `str.format()` Python method. It will receive the following arguments: `filename`, `line`, `character`, `tool`, `code`, `message`.

1.9 Included Integrations

TidyPy includes a handful of plugins/integrations that hook it into other tools.

pytest TidyPy can be run during execution of your [pytest](#) test suite. To enable it, you need to specify `--tidypy` on the command line when you run `pytest`, or include it as part of the `addopts` property in your `pytest` config.

nose TidyPy can be run during execution of your [nose](#) test suite. To enable it, you can either specify `--with-tidypy` on the command line when you run `nose`, or set the `with-tidypy` property to 1 in your `setup.cfg`.

pbbt TidyPy can be included in your [PBBT](#) scripts using the `tidypy` test. To enable it, you can either specify `--extend=tidypy.plugin.pbbt` on the command line when you run `PBBT`, or set the `extend` property in your `setup.cfg` or `pbbt.yaml` to `tidypy.plugin.pbbt`.

1.10 Extending TidyPy

A simple interface exists for extending TidyPy to include more and different tools and reporters. To add a tool, create a class that extends `tidypy.Tool`, and in your `setup.py`, declare an `entry_point` for `tidypy.tools` that points to your class:

```
entry_points={
    'tidypy.tools': [
        'mycooltool = path.to.model:MyCoolToolClassName',
    ],
}
```

To add a reporter, the process is nearly identical, except that you extend `tidypy.Report` and declare an `entry_point` for `tidypy.reports`.

1.11 FAQs

Aren't there already tools like this? Yup. There's [prospector](#), [pylama](#), [flake8](#), and [ciocheck](#) just to name a few. But, as is customary in the world of software development, if the wheel isn't as round as you'd like it to be, you must spend countless hours to reinvent it. I've tried a number of these tools (and even contributed to some), but in the end, I always found something lacking or annoying. Thus, TidyPy was born.

How do I run TidyPy on a single file? The short answer is, you don't (at the moment, anyway). It wasn't designed with that use case in mind. TidyPy was built to analyze a whole project, and show you everything.

I tried TidyPy out on my project and it reported hundreds/thousands of issues. My ego is now bruised. Yea, that happens. The philosophy I chose to follow with this tool is that I didn't want it to hide anything from me. I wanted its default behavior to execute every tool in its suite using their most obnoxious setting. Then, when I can see the full scope of damage, I can then decide to disable specific tools or issues via a project-level configuration. I figured if someone took the time to implement a check for a particular issue, they must think it has some value. If my tooling hides that from me by default, then I won't be able to gain any benefits from it.

In general, I don't recommend starting to use linters or other sorts of static analyzers when you think you're "done". You should incorporate them into your workflow right at the beginning of a project – just as you would (or should) your unit tests. That way you find things early and learn from them (or disable them). It's much less daunting a task to deal with when you address them incrementally.

1.12 Contributing

Contributions are most welcome. Particularly if they're bug fixes! To hack on this code, simply clone it, and then run `make setup`. This will create a `virtualenv` with all the tools you'll need. The `Makefile` also has a `test` target for running the `pytest` suite, and a `lint` target for running TidyPy on itself.

1.13 License

TidyPy is released under the terms of the [MIT License](#).

`tidypy.execute_tools` (*config*, *path*, *progress=None*)

Executes the suite of TidyPy tools upon the project and returns the issues that are found.

Parameters

- **config** (*dict*) – the TidyPy configuration to use
- **path** (*str*) – that path to the project to analyze
- **progress** (`tidypy.Progress`) – the progress reporter object that will receive call-backs during the execution of the tool suite. If not specified, no progress notifications will occur.

Return type `tidypy.Collector`

`tidypy.execute_reports` (*config*, *path*, *collector*, *on_report_finish=None*, *output_file=None*)

Executes the configured suite of issue reports.

Parameters

- **config** (*dict*) – the TidyPy configuration to use
- **path** (*str*) – that path to the project that was analyzed
- **collector** (`tidypy.Collector`) – the issues to report

`tidypy.get_tools` ()

Retrieves the TidyPy tools that are available in the current Python environment.

The returned dictionary has keys that are the tool names and values are the tool classes.

Return type `dict`

`tidypy.get_reports` ()

Retrieves the TidyPy issue reports that are available in the current Python environment.

The returned dictionary has keys are the report names and values are the report classes.

Return type `dict`

`tidypy.get_extenders()`

Retrieves the TidyPy configuration extenders that are available in the current Python environment.

The returned dictionary has keys are the extender names and values are the extender classes.

Return type dict

`tidypy.get_default_config()`

Produces a stock/out-of-the-box TidyPy configuration.

Return type dict

`tidypy.get_user_config(project_path, use_cache=True)`

Produces a TidyPy configuration that incorporates the configuration files stored in the current user's home directory.

Parameters

- **project_path** (*str*) – the path to the project that is going to be analyzed
- **use_cache** (*bool*) – whether or not to use cached versions of any remote/referenced TidyPy configurations. If not specified, defaults to `True`.

Return type dict

`tidypy.get_local_config(project_path, use_cache=True)`

Produces a TidyPy configuration using the `pyproject.toml` in the project's directory.

Parameters

- **project_path** (*str*) – the path to the project that is going to be analyzed
- **use_cache** (*bool*) – whether or not to use cached versions of any remote/referenced TidyPy configurations. If not specified, defaults to `True`.

Return type dict

`tidypy.get_project_config(project_path, use_cache=True)`

Produces the TidyPy configuration to use for the specified project.

If a `pyproject.toml` exists, the configuration will be based on that. If not, the TidyPy configuration in the user's home directory will be used. If one does not exist, the default configuration will be used.

Parameters

- **project_path** (*str*) – the path to the project that is going to be analyzed
- **use_cache** (*bool*) – whether or not to use cached versions of any remote/referenced TidyPy configurations. If not specified, defaults to `True`.

Return type dict

`tidypy.purge_config_cache(location=None)`

Clears out the cache of TidyPy configurations that were retrieved from outside the normal locations.

class `tidypy.Tool` (*config*)

The base class for TidyPy tools.

Parameters **config** (*dict*) – the tool configuration to use during execution

classmethod `can_be_used()`

Indicates whether or not this tool can be executed now. Useful when you need to check for certain environmental conditions (e.g., Python version, dependency availability, etc).

Unless overridden, always returns `True`.

Return type bool

config = None

The tool's configuration to use during its execution.

execute (*finder*)

Analyzes the project and generates a list of issues found during that analysis.

Must be implemented by concrete classes.

Parameters **finder** (`tidypy.Finder`) – the Finder class that should be used to identify the files or directories that the tool will analyze.

Return type `list(tidypy.Issue)`

classmethod **get_all_codes** ()

Produces a sequence of all the issue codes this tool is capable of generating. Elements in this sequence must all be 2-element tuples, where the first element is the code, and the second is a textual description of what the code means.

Must be implemented by concrete classes.

Returns tuple of tuples containing two strings each

classmethod **get_default_config** ()

Produces a tool configuration stanza that acts as the base/default for this tool.

rtype: dict

class `tidypy.PythonTool` (*config*)

A convenience abstract class that automatically sets the `filters` in the tool configuration to target Python source files.

Parameters **config** (*dict*) – the tool configuration to use during execution

classmethod **get_default_config** ()

Produces a tool configuration stanza that acts as the base/default for this tool.

rtype: dict

class `tidypy.Issue` (*code=None, message=None, filename=None, line=None, character=None*)

A class that encapsulates an issue found during the analysis of a project.

character = None

The character number within the line of the file where the issue was found (if known). The first column in a line is notated as 1 (not zero).

code = None

A string containing a code that identifies the type of issue found.

filename = None

A string containing the full path to the file where the issue was found.

line = None

The line number within the file where the issue was found (if known). The first line in a file is notated as 1 (not zero).

message = None

A string containing a description of the issue.

pylint_type = 'E'

A character indicating the comparable pylint category this issue would fall into: E=error, W=warning, R=refactor, C=convention

tool = None

A string containing name of the tool that found the issue.

class tidy.py.TidyPyIssue(*code=None, message=None, filename=None, line=None, character=None*)

The base class for all TidyPy application issues that are produced.

class tidy.py.UnknownIssue(*exc, filename*)

A completely unanticipated exception/problem was encountered during the execution of a tool.

class tidy.py.AccessIssue(*exc, filename*)

An issue indicating that a file/directory cannot be accessed (typically due to permissions).

class tidy.py.ParseIssue(*exc, filename, line=None, character=None*)

An issue indicating that a file could not be parsed as expected (e.g., a Python source file with invalid syntax).

class tidy.py.ToolIssue(*message, project_path, details=None, failure=False*)

An issue indicating that a tool completely crashed/failed during its execution.

class tidy.py.Finder(*base_path, config*)

A class that encapsulates the logic of finding files in a project that will be analyzed.

Parameters

- **base_path** (*str*) – the path to the base of the project
- **config** (*dict*) – the configuration to use when searching the project

directories (*filters=None, containing=None*)

A generator that produces a sequence of paths to directories in the project that matches the specified filters.

Parameters

- **filters** (*list(str)*) – the regular expressions to use when finding directories in the project. If not specified, all directories are returned.
- **containing** (*list(str)*) – if a directory passes through the specified filters, it is checked for the presence of a file that matches one of the regular expressions in this parameter.

files (*filters=None*)

A generator that produces a sequence of paths to files in the project that matches the specified filters.

Parameters **filters** (*list(str)*) – the regular expressions to use when finding files in the project. If not specified, all files are returned.

is_excluded (*path*)

Determines whether or not the specified file is excluded by the project's configuration.

Parameters **path** (*pathlib.Path*) – the path to check

Return type bool

is_excluded_dir (*path*)

Determines whether or not the specified directory is excluded by the project's configuration.

Parameters **path** (*pathlib.Path*) – the path to check

Return type bool

modules (*filters=None*)

A generator that produces a sequence of paths to files that look to be Python modules (e.g., *.py).

Parameters **filters** (*list(str)*) – the regular expressions to use when finding files in the project. If not specified, all files are returned.

packages (*filters=None*)

A generator that produces a sequence of paths to directories that look to be Python packages (e.g., they contain an `__init__.py`).

Parameters `filters` (`list (str)`) – the regular expressions to use when finding directories in the project. If not specified, all directories are returned.

project_path

The path to the project that this Finder is operating from.

read_file (`filepath`)

Retrieves the contents of the specified file.

This function performs simple caching so that the same file isn't read more than once per process.

Parameters `filepath` (`str`) – the file to read.

Return type `str`

relative_to_project (`filepath`)

Reformats a file path to be relative to this Finder's project path.

Parameters `filepath` (`str` or `pathlib.Path`) – the path to reformat

Return type `str`

sys_paths (`filters=None`)

Produces a list of paths that would be suitable to use in `sys.path` in order to access the Python modules/packages found in this project.

Parameters `filters` (`list (str)`) – the regular expressions to use when finding files in the project. If not specified, all files are returned.

class `tidypy.Collector` (`config`)

A class that contains all the issues found during an execution of the TidyPy tool suite.

Parameters `config` (`dict`) – the configuration used to during the analysis of the project

add_issues (`issues`)

Adds an issue to the collection.

Parameters `issues` (`tidypy.Issue` or `list (tidypy.Issue)`) – the issue(s) to add

get_grouped_issues (`keyfunc=None`, `sortby=None`)

Retrieves the issues in the collection grouped into buckets according to the key generated by the `keyfunc`.

Parameters

- **keyfunc** (`func`) – a function that will be used to generate the key that identifies the group that an issue will be assigned to. This function receives a single `tidypy.Issue` argument and must return a string. If not specified, the filename of the issue will be used.
- **sortby** (`list (str)`) – the properties to sort the issues by

Return type `OrderedDict`

get_issues (`sortby=None`)

Retrieves the issues in the collection.

Parameters `sortby` (`list (str)`) – the properties to sort the issues by

Return type `list(tidypy.Issue)`

issue_count (`include_unclean=False`)

Returns the number of issues in the collection.

Parameters `include_unclean` (`bool`) – whether or not to include issues that are being ignored due to being a duplicate, excluded, etc.

Return type `int`

class `tidypy.Report` (*config, base_path, output_file=None*)

The base class for TidyPy issue reporters.

Parameters

- **config** (*dict*) – the configuration used during the analysis of the project
- **base_path** (*str*) – the path to the project base directory

execute (*collector*)

Produces the contents of the report.

Must be implemented by concrete classes.

Parameters **collector** (`tidypy.Collector`) – the collection of issues to report on

output (*msg, newline=True*)

Writes the specified string to the output target of the report.

Parameters

- **msg** (*str*) – the message to output.
- **newline** (*str*) – whether or not to append a newline to the end of the message

relative_filename (*filename*)

Generates a path for the specified filename that is relative to the project path.

Parameters **filename** (*str*) – the filename to generate the path for

Return type `str`

class `tidypy.Extender`

The base class for TidyPy configuration extenders.

classmethod **can_handle** (*location*)

Indicates whether or not this Extender is capable of retrieving the specified location.

Parameters **location** (*str*) – a URI indicating where to retrieve the TidyPy configuration from

Return type `bool`

classmethod **parse** (*content, is_pyproject=False*)

A convenience method for parsing a TOML-serialized configuration.

Parameters

- **content** (*str*) – a TOML string containing a TidyPy configuration
- **is_pyproject** (*bool*) – whether or not the content is (or resembles) a `pyproject.toml` file, where the TidyPy configuration is located within a key named `tool`.

Return type `dict`

classmethod **retrieve** (*location, project_path*)

Retrieves a TidyPy configuration from the specified location.

Parameters

- **location** (*str*) – a URI indicating where to retrieve the TidyPy configuration from
- **project_path** (*str*) – the full path to the project's base

Return type `dict`

exception `tidypy.ExtenderError`

The base class for all exceptions raised by an Extender during its operation.

exception `tidypy.DoesNotExistError`

An exception indicating that the specified Extender does not exist in the current environment.

class `tidypy.Progress`

An interface for receiving events that occur during the execution of the TidyPy tool suite.

on_finish()

Called after all tools in the suite have completed.

on_start()

Called when the execution of the TidyPy tool suite begins.

on_tool_finish(*tool*)

Called when an individual tool completes execution.

Parameters *tool* (*str*) – the name of the tool that completed

on_tool_start(*tool*)

Called when an individual tool begins execution.

Parameters *tool* (*str*) – the name of the tool that is starting

class `tidypy.QuietProgress`

An implementation of `tidypy.Progress` that produces no output.

class `tidypy.ConsoleProgress`(*config*)

An implementation of `tidypy.Progress` that outputs a progress bar to the console.

on_finish()

Called after all tools in the suite have completed.

on_start()

Called when the execution of the TidyPy tool suite begins.

on_tool_finish(*tool*)

Called when an individual tool completes execution.

Parameters *tool* (*str*) – the name of the tool that completed

on_tool_start(*tool*)

Called when an individual tool begins execution.

Parameters *tool* (*str*) – the name of the tool that is starting

3.1 0.21.1 (2021-09-14)

Fixes

- Fixed an installation failure due to an old version of `demjson` not working with `setuptools>=58`.

3.2 0.21.0 (2021-08-28)

Enhancements

- Upgraded the `pylint` tool.
- Upgraded the `pep8-naming` plugin of the `pycodestyle` tool.

3.3 0.20.0 (2021-03-19)

Enhancements

- Upgraded the `pylint`, `secrets`, `pyroma`, `pydocstyle`, `pycodestyle`, and `pyflakes` tools.

3.4 0.19.0 (2021-01-16)

Enhancements

- Upgraded the `manifest` tool.

Fixes

- Fixed a crash due to the latest version of `vulture`.

3.5 0.18.0 (2020-11-27)

Enhancements

- Upgraded the `manifest` and `dlint` tools.

Fixes

- Fixed an issue that caused crashes when specifying additional options to the `yamllint` tool.

3.6 0.17.0 (2020-10-10)

Enhancements

- Upgraded the `manifest` and `eradicate` tools.

3.7 0.16.0 (2020-09-12)

Enhancements

- Upgraded the `pylint` and `vulture` tools.
- Addd a `--config` option to the `check` command.

3.8 0.15.0 (2020-07-12)

Enhancements

- Upgraded the `secrets` and `manifest` tools.
- Upgraded the `pep8-naming` plugin of the `pycodestyle` tool.

Fixes

- Fixed an crash that occurred with v1.5 of `vulture`.

3.9 0.14.0 (2020-05-12)

Enhancements

- Upgraded the `pycodestyle`, `pylint`, and `pyflakes` tools.

3.10 0.13.0 (2020-04-10)

Enhancements

- Upgraded the `dlint` and `manifest` tools.
- Upgraded the `pep8-naming` plugin of the `pycodestyle` tool.

Fixes

- Fixed a dependency conflict with `pyflakes`.

3.11 0.12.0 (2020-01-05)

Enhancements

- Upgraded the `manifest`, `secrets`, `pydocstyle`, and `dlint` tools.
- Upgraded the `pep8-naming` plugin of the `pycodestyle` tool.

Changes

- Removed support for Python 2.
- Removed the `setuptools` plugin, as it was causing many problems, and was little-used, anyway.

3.12 0.11.0 (2019-09-29)

Enhancements

- Added the `dlint` tool.
- Upgraded the `pylint`, `pydocstyle`, and `manifest` tools.

Fixes

- Fixed an issue with the most recent version of the `vulture` tool crashing.

3.13 0.10.1 (2019-06-02)

Fixes

- Fixed an issue listing the codes from the most recent version of the `pyroma` tool.

3.14 0.10.0 (2019-05-18)

Enhancements

- Upgraded the `manifest` tool.
- Enabled the `eradicate` tool in PY3 environments.

3.15 0.9.0 (2019-03-16)

Enhancements

- Upgraded the `pylint` and `secrets` tools.
- Added a reporter named `pylint-parseable` that emulates `pylint`'s “parseable” output format.
- Added a reporter named `custom` that allows you to specify the output format of issues.
- Added support for the `vulture` options `ignore-names`, `ignore-decorators`, and `min-confidence` (thanks `acaprari`).

3.16 0.8.0 (2019-01-30)

Enhancements

- Added ability to specify a filename for reports on the command line (thanks `douardda`).
- Upgraded the `secrets`, `pylint`, `pycodestyle`, and `eradicate` tools.
- Upgraded the `pep8-naming` plugin of the `pycodestyle` tool.

3.17 0.7.0 (2018-10-24)

Enhancements

- Upgraded the `pycodestyle`, `pydocstyle`, `vulture`, and `pyflakes` tools.
- Added ability to distinguish and disable specific codes from the `secrets` tool.

3.18 0.6.0 (2018-09-30)

Enhancements

- Added the `secrets` tool.
- Enabled the `pydiatra` tool on windows (thanks [jwilk](#)).
- Upgraded the `pylint` and `vulture` tools.
- Upgraded the `pep8-naming` plugin of the `pycodestyle` tool.

Fixes

- Fixed an issue with `rstlint` crashing due to recent updates to Sphinx.

3.19 0.5.0 (2018-05-05)

Enhancements

- Added `manifest` and `pydiatra` tools.
- Upgraded the `pylint` tool.
- Upgraded the `pep8-naming` plugin of the `pycodestyle` tool.
- Added some convenience handling of the `License` vs `Licence` and `LicenceClassifier` vs `LicenseClassifier` codes reported by `pyroma`.
- Added the first draft of the project documentation.
- Added an `extensions` command that will output a listing of all the available tools, reports, and extenders that are available.

Fixes

- Fixed the character location reported in `pylint` issues being off-by-one.
- Fixed various issues with the `pyroma` tool leaking problems to `stderr`.

3.20 0.4.0 (2017-12-02)

Enhancements

- Added a `sphinx-extensions` option to the `rstlint` tool to enable the automatic recognition of Sphinx-specific extensions to ReST (Sphinx must be installed in the same environment as TidyPy for it to work).
- Added a `ignore-roles` option to the `rstlint` tool to help deal with non-standard ReST text roles.

- Changed tool execution from a multithreaded model to multiprocessing. Larger projects should see an improvement in execution speed.

Changes

- The `--threads` option to the `check` command has been changed to `--workers`.

Fixes

- Fixed an issue that caused the `pylint` tool to crash when it encountered `duplicate-code` issues on files that are being excluded from analysis.

3.21 0.3.0 (2017-11-18)

Enhancements

- Added `ignore-directives` and `load-directives` options to the `rstlint` tool to help deal with non-standard ReST directives.
- Added support for the `extension-pkg-whitelist` option to the `pylint` tool.
- Added `install-vcs` and `remove-vcs` commands to install/remove pre-commit hooks into the VCS of a project that will execute TidyPy. Currently supports both Git and Mercurial.

Changes

- Changed the `merge_issues` and `ignore_missing_extends` options to `merge-issues` and `ignore-missing-extends` for naming consistency.
- Replaced the `radon` tool with the traditional `mccabe` tool.

Fixes

- Fixed issue that caused TidyPy to spin out of control if you used CTRL-C to kill it while it was executing tools.
- Fixed issue where `pylint`'s `duplicate-code` issue was reported only against one file, and it was usually the wrong file. TidyPy will now report an issue against each file identified with the duplicate code.
- Numerous fixes to support running TidyPy on Windows.

3.22 0.2.0 (2017-11-04)

Enhancements

- Added a `2to3` tool.
- All tools that report issues against Python source files can now use the `# noqa` comment to ignore issues for that specific line.
- Added support for the `ignore-nosec` option in the `bandit` tool.
- Added the ability for TidyPy configurations to extend from other configuration files via the `extends` property.
- Upgraded the `vulture` tool.
- Upgraded the `pyflakes` tool.

Changes

- Changed the `--no-merge` and `--no-progress` options to the `check` command to `--disable-merge` and `--disable-progress`.

- The `check` command will now return 1 to the shell if TidyPy finds issues.
- No longer overriding `pycodestyle`'s default `max-line-length`.

Fixes

- If any tools output directly to `stdout` or `stderr`, TidyPy will now capture it and report it as a `tidypy:tool` issue.
- Fixed crash/hang that occurred when using `--disable-progress`.

3.23 0.1.0 (2017-10-15)

- Initial public release.
